

# **Water Quality Oral Presentation Instructions**

## **Upward Bound, Summer 2017**

### **Overview**

Each group will work together to prepare and deliver an oral presentation for the water quality project. Every student in the group should put in equal effort and deliver an equal portion of the presentation. It is up to each group to decide which student is responsible for specific content. For example, perhaps one student will present the results and the other student will present background information on the contaminants.

### **Length**

Each group's presentation should be 5-7 minutes in length. The time should be divided equally among all students in the group.

### **Content**

The presentation should contain at least two topics:

1. Your group's results
2. Your assigned contaminant(s)

Each group will be assigned 1-3 contaminants to research and present. For example, if a group was assigned arsenic, the instructor would expect to hear about:

- What it is
- Where it is commonly found
- How it makes its way into the water
- Why it is considered dangerous
- How it can be removed from water

There are many websites that contain this kind of information. Here are a few that will get you started:
